BINTA KANDE

Checklist: 12 security points for your website

What gets checked first, without being a technician.

Tick what you can confirm. Whatever stays empty should be checked first. No list can guarantee that a site is invulnerable: the goal is to reduce the most common risks.

The basics

- [ ] My site opens in https (padlock) on every page
- [ ] The certificate has not expired
- [ ] My site and its plugins are up to date
- [ ] I removed unused plugins without leaving leftovers
- [ ] I deleted accounts and access I no longer need

Access

- [ ] My admin password is long and unique
- [ ] Admin access asks for a second verification
- [ ] Each person has their own access, with minimum rights

Data and backups

- [ ] My forms send data securely
- [ ] I have a recent backup, stored somewhere other than the site
- [ ] I have already tested restoring a backup

Required pages

- [ ] Legal notice and privacy policy are online
- [ ] A cookie banner that lets people refuse

What about the empty boxes?

Start with access and backups: those are the points where a mistake costs the most. For a full report, ranked by priority, I offer a security diagnosis.
